What the Advanced Clean Truck Rule Will Do for Connecticut

**Big trucks and buses cause disproportionate harm.**

*On Connecticut’s roads, big trucks and buses make up:*

- 6% of vehicles

*However, when it comes to the emissions released by all on-road vehicles in Connecticut, trucks and buses are responsible for:*

- 25% of global warming emissions
- 45% of PM$_{2.5}$
- 53% of NO$_x$

**Deploying electric trucks and low-NO$_x$ diesel engines would help Connecticut’s economy . . .**

- $1.2$ billion in health-related savings
- $467$ million in annual net societal benefits in 2050
- $4.3$ billion in net cumulative societal benefits

. . . and improve Connecticut’s environment and health.

- NO$_x$ reduced by **86%**
- PM$_{2.5}$ reduced by **27%**

*More than doubling* expected reductions of NO$_x$ and PM$_{2.5}$ by 2050

- **102** avoided hospital visits
- **104** avoided premature deaths

Electric trucks and buses eliminate toxic tailpipe pollutants compared with their conventional counterparts—and also carbon emissions, if the electricity or hydrogen comes from renewable sources. Read on to learn about the public health, environmental, and economic costs and benefits of Connecticut adopting policies that bring more electric trucks and buses on the road.
**How Clean Trucks Can Benefit Connecticut**

Buses, delivery vehicles, tractor-trailer trucks, and other medium- and heavy-duty (M/HD) vehicles are an essential part of our economy. Though their operation facilitates commerce, trucks and buses are also a significant source of toxic air pollution and climate-changing carbon emissions. Conversely, electric trucks and buses powered by batteries or hydrogen fuel cells eliminate toxic tailpipe pollutants, and when powered by clean electricity or hydrogen, can operate with zero carbon emissions as well.

These vehicles are becoming increasingly available, and regulatory efforts such as California’s Advanced Clean Trucks (ACT) rule can speed the transition to a future in which transportation poses less risk to public health and the climate. California adopted the ACT in 2020, requiring truck manufacturers to produce and sell an increasing percentage of zero-emissions M/HD vehicles. Under the Clean Air Act, California can set emissions standards such as the ACT that are stricter than federal standards, and other states may then adopt California’s rules.

A recent study commissioned by the Union of Concerned Scientists and the Natural Resources Defense Council evaluated the public health, environmental, and economic costs and benefits of Connecticut and other Northeast states adopting the ACT and a related regulation, called the Heavy-Duty Omnibus (HDO) rule, that will reduce nitrogen oxide (NO\textsubscript{x}) emissions from internal combustion M/HD vehicles. This fact sheet highlights the key results.

**Big Trucks, Even Bigger Impacts**

The nearly 145,210 M/HD vehicles on Connecticut’s roads significantly impact public health and the environment. Although they represent only about 5 percent of all vehicles on Connecticut roads and highways, these big trucks and buses are responsible for around 25 percent of the state’s global warming pollution, approximately 53 percent of its NO\textsubscript{x} and 45 percent of its fine particulate matter (PM\textsubscript{2.5}) from on-road vehicles.

**Long term exposure of NO\textsubscript{x} and PM\textsubscript{2.5} can have life-threatening consequences and damage ecosystems already threatened by climate change.**

**Under the ACT, nearly 30 percent of medium- and heavy-duty vehicle sales in Connecticut will be zero-emissions trucks by 2030, where far less than 1 percent are today.**

Short-term exposure to toxic air pollutants such as NO\textsubscript{x} and PM\textsubscript{2.5} aggravates respiratory symptoms, especially in vulnerable populations, and long-term exposure at even moderate concentrations can have life-threatening consequences. These health impacts significantly reduce Connecticut’s economic productivity, and the state’s environment suffers too: NO\textsubscript{x} and PM\textsubscript{2.5} damage sensitive ecosystems and acidify rain, streams, rivers, and lakes. Climate change will intensify these effects.

**Clean Trucks for Connecticut**

In 2022, the Connecticut legislature is poised to consider legislation that would enable the Department of Energy and Environmental Protection to adopt California’s ACT and HDO rules; the former will require a growing percentage of the new trucks and buses being sold to be zero emissions beginning in 2024, and the latter will minimize toxic air pollution from new diesel trucks. Adopting the ACT will put Connecticut well on the path to a cleaner and more efficient transportation future: by 2030, nearly 30 percent of M/HD vehicle sales in the state will be zero-emissions trucks, where far less than 1 percent are today. That share of annual sales is estimated to rise to nearly 60 percent by 2035, eliminating almost 16 million metric tons of carbon dioxide cumulative through 2050. This shift to cleaner trucks will bring significant health, economic, and environmental benefits to Connecticut residents.

**Cleaner Trucks, Clear Health Benefits**

With the ACT and HDO regulations in place, Connecticut will see a nearly 86 percent reduction in NO\textsubscript{x} emissions from M/HD vehicles in 2050 and a 27 percent reduction in PM\textsubscript{2.5} emissions, resulting in approximately 104 fewer premature deaths, 102 fewer hospital visits, and more than 57,000 avoided minor sicknesses. This amounts to around $1.2 billion in savings from avoided health care costs.
Clean Trucks Mean Business

Connecticut’s economy will also benefit from the savings that zero-emissions M/HD vehicles will bring to truck operators and businesses—nearly $470 million annually in 2050—along with increased electric utility revenue and air quality and climate benefits. While the sticker price of electric trucks may be higher than comparable diesel trucks today, continuing reductions in battery costs and vastly reduced fuel and maintenance expenses mean that electric truck operators will see more than $8,000 in net lifetime savings per vehicle by 2040.

Connecticut Can Still Aim Higher

Connecticut’s transition to cleaner, more efficient trucks and buses under the ACT and HDO would be good for the state’s environment, economy, and human health—but these rules would still leave some benefits on the table. If Connecticut adopts additional policies to ensure that all new M/HD vehicles sold by 2040 produce zero emissions, the state will see more than twice the reduction in global warming pollution by 2050 (87 percent lower than the baseline) and a 20 percent increase in cumulative health-related savings.

The content of this fact sheet is distilled from the Southern New England Clean Trucks Program report conducted by M.J. Bradley for the Union of Concerned Scientists and Natural Resources Defense Council. Read the report online at www.ucsusa.org/resources/truck-pollution-united-states.
