GLOBAL WARMING

Global warming is a real, and human activity has been a contributor since 1650. But global warming is also a very complicated and difficult issue that can provide very mixed policy in response to political pressure. Although there are many different legislative proposals for substantial reductions in carbon dioxide emissions, there is no one-size-fits-all solution that can accomplish the goal of each legislation.

Fortunately, and contrary to much of the rhetoric surrounding climate change, there is ample time to develop such technologies, which will require substantial capital investment by individuals.
